

Objective

In this exercise, we'd like you to design and implement a small application that retrieves and processes candidate data from public endpoints.

You'll find the main data source [here](#)
And supplemental LinkedIn data [here](#)

Requirements

- Fetch and parse candidate data.
Extract and present each candidate's:
 - Full name
 - Work experience (role, start and end dates, location)
 - LinkedIn profile (if available)
- Detect and indicate any significant employment gaps between jobs.
- Present the information in:
 - A readable text format (e.g., printed or logged output)
 - A structured JSON format

Example output (text):

```
Hello Shimon Peres,  
LinkedIn: https://linkedin.com/in/shimon123  
Worked as: Programmer, From Jan/20/2013 To Dec/31/2014 in New  
York, NY, US  
Gap in CV for 20 days  
Worked as: Programmer, From Jan/02/2010 To Dec/31/2012 in Newark,  
NJ, US
```

Example output (JSON):

```
{  
  "Name": {  
    "FirstName": "Shimon",  
    "LastName": "Peres"  
  },  
  "Linkedin_url": "https://linkedin.com/in/shimon123",  
  "JobExperience": [  
    {  
      "Role": "Programmer",  
      "StartDate": "Jan/20/2013",  
      "EndDate": "Dec/31/2014",  
      "Location": "New York, NY, US",  
      "Gap": "20 days"  
    },  
    {  
      "Role": "Programmer",  
      "StartDate": "Jan/02/2010",  
      "EndDate": "Dec/31/2012",  
      "Location": "Newark, NJ, US"  
    }  
  ]  
}
```

Interview Format

- The coding session is 1 hour.
- Feel free to ask questions and clarify the task before we begin.
- We'll stay on the call with the mic and camera off during the coding period. You're welcome to reach out at any time if you need clarifications.
- We'll ask you to walk us through your solution at the end, focusing on the design choices you made and how you approached the problem.

Guidance

- Feel free to make reasonable assumptions for anything not explicitly defined.
- Feel free to use any AI tooling that you wish. Our expectation is a working solution that you thoroughly understand and can defend implementation decisions for. We will review the prompts you used during this process together, as we care about how you interact with the AI.
- You may choose any programming language and tooling you're comfortable with.
- We're looking for clean, well-structured, and maintainable code that reflects good engineering practices.
- Please prioritize readability, modularity, and extensibility in your design.
- We're interested in your interpretation of "production-ready" code. Make design decisions you're proud of and would be comfortable maintaining.

Let us know when you're ready, and good luck!
